(54) Title: TUBING EXPANSION

(57) Abstract: A method of coupling first and second tubulars (12, 14) comprises providing a first tubular having a first yield strength and a second tubular having a higher second yield strength. A portion of the first tubular is located within and overlapping a portion of the second tubular and the first tubular is expanded sufficient to expand the second tubular, at least the first tubular being expanded beyond its yield point. Following expansion, a degree of elastic contraction of the tubulars is permitted, sufficient to provide interference between the tubulars.

TUBING EXPANSION

FIELD OF THE INVENTION

The present invention relates to tubing expansion. In particular, the invention relates to expansion of a first tubular within a larger diameter second tubular to provide
5 interference between the tubulars.

BACKGROUND OF THE INVENTION

In the oil and gas exploration and extraction industry, well bores are lined with metal tubing. Typically, the majority of a well will be lined with tubing
10 known as casing, while the distal end of the well is provided with smaller diameter tubing known as liner. Generally, the section of the well provided with the liner will intersect the hydrocarbon-bearing formation. The liner may be suspended from the lower end of the casing by
15 means of a liner hanger.

Conventionally, the liner hanger is a tubular assembly which is mounted on the upper end of the liner. The hanger is run into the casing with the liner and then configured first to engage and then to seal with the casing inner
20 surface.

There is an undesirable loss of liner internal diameter associated with the provision of conventional

liner hangers, and this is one reason behind the development of alternative hanger arrangements, such as proposed in WO99/18328 (Bailey et al). The disclosed hanger arrangement is achieved by expanding the upper end
5 of the liner within a larger diameter casing, with a tubular spacer located therebetween. The liner, casing and spacer are of similar material. The liner is expanded past its yield point sufficiently to expand the spacer and the casing, with the intention that, following release of the
10 expansion force, the elastic recovery of the liner is less than the elastic recovery for the casing. It is suggested that this provides for interference between the expanded liner, spacer and casing, sufficient to provide the necessary hanging support for the liner.

15 It is among the objectives of embodiments of the invention to provide a method and apparatus for use in forming a liner hanger which will provide a secure and reliable coupling between the liner and casing.

SUMMARY OF THE INVENTION

20 According to a first aspect of the present invention there is provided a method of coupling first and second tubulars, the method comprising:

providing a first tubular of a first diameter and having a first yield strength;

25 providing a second tubular of a second diameter

greater than said first diameter and having a second yield strength greater than said first yield strength;

5 locating at least a portion of the first tubular within and overlapping with at least a portion of the second tubular;

expanding said portion of the first tubular sufficient to expand said portion of the second tubular, at least the first tubular being expanded beyond its yield point; and

10 permitting at least a degree of elastic contraction of the tubulars sufficient to provide interference between the tubulars.

According to a second aspect of the present invention there is provided a method of coupling first and second tubulars, the method comprising:

15 providing a first tubular of a first diameter and having a first modulus of elasticity;

providing a second tubular of a second diameter greater than said first diameter and having a second modulus of elasticity lower than said first modulus of elasticity;

20 elasticity;

locating at least a portion of the first tubular within at least a portion of the second tubular;

expanding said portion of the first tubular sufficient to expand said portion of the second tubular; and

25 permitting at least a degree of elastic contraction of the tubulars sufficient to provide interference between the

tubulars.

The invention also relates to apparatus for use in implementing the methods.

In both aspects of the present invention, selection of
5 the properties of the tubulars facilitates provision of
interference between the tubulars; the elastic recovery of
the outer second tubular will be greater than the elastic
recovery of the inner tubular. Earlier proposals have
suggested that this effect may be achieved using tubulars
10 formed of similar materials. However, where similar
materials are utilised, this effect is less easily
achieved, and in some cases may result in minimal or even
no coupling between the tubulars. It is believed that this
problem may have been disguised in prior proposals by the
15 provision of elastomeric seals and the like between the
tubulars; the poor coupling between the tubulars themselves
may not have been apparent due to the coupling effect
provided by the expanded seals.

These aspects of the invention have particular utility
20 in downhole applications, where the tubulars, such as liner
and casing, may be coupled to provide a hanger for the
first tubular. In such applications it is of course
preferred that the interference between the tubulars is
sufficient to provide hanging support for the first
25 tubular, and furthermore that the interference between the
tubulars is such that a fluid seal is provided between the

tubulars.

Preferably, the second tubular is expanded to or beyond its yield point, this being particularly advantageous in respect of the first aspect. To ensure
5 that the second tubular is expanded beyond its yield point, the degree of expansion may be selected to accommodate variables which may impact on the expansion process, such as variations in tubular wall thickness; API specifications permit a degree of variation in tubular wall thickness
10 which would make it difficult to guarantee a specific degree of expansion, unless higher specification or specially manufactured or machined tubulars were utilised. Thus, it may be known that the wall thicknesses of the tubulars may vary by plus or minus 10%, such that the
15 degree of expansion is selected to be high enough to ensure that one or preferably both of the tubulars will pass through yield.

Preferably, in the second aspect, as in the first aspect, the first tubular is expanded to or beyond its
20 yield point, such that the tubular is subject to plastic deformation which is retained following elastic recovery.

Each tubular may have substantially constant material properties over its length. Alternatively, said portion may feature different material properties than the
25 remainder of the tubular. Thus, for example, a second tubular may be provided which is formed substantially of a

steel-based alloy, with only an end portion formed of a relatively expensive low modulus titanium alloy, or a material having a higher yield strength than the steel-based alloy.

5 The material properties, that is the yield strength or elastic or Young's modulus, of the tubulars may be substantially constant across the thickness of the tubular walls. Alternatively, the material properties may vary across the thickness of the tubular walls. This may be
10 achieved by a number of means, for example selective localised heat treatment of a portion of the tubular wall. In other examples, the tubular wall may comprise two or more different materials, for example the tubular wall may incorporate bands of different materials having different
15 properties. The different materials may be integral or may be present as separate members. In one embodiment a ring or sleeve of relatively high yield strength or low modulus may be provided externally of an otherwise conventional second tubular. Thus embodiments of the invention may be
20 provided utilising substantially conventional tubulars, which may even be of the same material, by providing a close-fitting ring or band of a material such as titanium around the second tubular.

 The tubulars may be expanded by any appropriate
25 method, including forcing an expansion swage, cone or mandrel through the tubulars, or applying an elevated

hydraulic pressure to the inner diameter of the first tubular, or a combination of both. The swage or cone may take any appropriate form, and may include rolling or low friction surfaces to facilitate translation of the expansion device through the tubulars. Such expansion induces circumferential stretching or strain in the tubulars. For such mechanisms, it is important that the second tubular is free to expand, preferably to and beyond yield, and in downhole applications of the invention this may require that the annulus surrounding the second tubular is not filled by incompressible material, such as set cement or a part of the bore wall which would restrict or prevent any such expansion. An arrangement for facilitating provision of such an annulus is described in applicant's PCT/GB01/04202, the disclosure of which is incorporated herein by reference. Such an arrangement may be provided in combination with the present invention. However, in some circumstances it may be difficult if not impossible to guarantee that the annulus is or remains clear, or that some other variable will impact on the ability to expand the second tubular to the desired extent.

In such cases it may be desirable to provide an expansion device having a degree of compliance, that is a device which will normally expand the tubulars to the desired, predetermined extent, but which is capable of accommodating reductions in the degree of expansion, as may occur if the

wall of one or both of the tubulars was unusually thick or if there was a reduction in bore diameter due to a swelling formation. In the absence of such compliance, a fixed diameter expansion cone or swage would be unable to pass through the restriction, and could become stuck fast at the restriction. Most preferably, the degree of compliance built into the cone or swage is such that the minimum degree of expansion provided by the swage is sufficient to expand the first tubular through yield.

Alternatively, or in addition, it may be possible to expand the tubulars utilising a rolling or rotary expansion device, which may or may not be compliant, such as the various expansion devices which are available from the applicants, and as described in WO00\37766 and US 09\469,690, the disclosures of which are incorporated herein by reference.

Spacing, sealing or gripping members may be provided on one or both of the tubulars, or for location between the tubulars. The sealing members may include elastomeric rings or sleeves, or bands of formable material, such as relatively soft metal such as lead or bronze. The gripping members may include slips or teeth of relatively hard material, or elements of relatively hard material, such as tungsten carbide, that will bite into the opposing surfaces of the tubulars. However, it is believed that the degree of interference provided by the present invention is such

that, for the majority of applications, no such seals or spacers will be required, and that the first tubular will be in direct contact with the second tubular.

The yield strength of the first tubular is preferably
5 selected to be lower than the yield strength of the second tubular before any expansion or deformation has taken place. However, it is more important that the yield strength of the first tubular is lower than the yield strength of the second tubular at the point when
10 deformation of the second tubular is initiated, most preferably on first contact between the tubulars. For example, it may be proposed to utilise a low yield point highly ductile alloy steel first tubular in a situation where significant clearance is to be provided between the
15 unexpanded tubular and the casing or second tubular through which the expandable tubular is run, to allow for fluid bypass when running into the well bore. Thus, in order to engage the casing, the expandable first tubular would have to be expanded a considerable way beyond its yield point
20 before the tubular makes contact with the surrounding casing. In the process of expansion the material properties of the inner tubular change due to the material being cold worked; the yield point will increase, with the possibility of the yield point becoming higher than the
25 yield point of the outer casing. In the event that this does occur, there is the possibility that minimal or even

no interference will be established between the tubulars, even if both are then further expanded past yield. Another aspect of the invention therefore relates to determining the yield point of a first tubular at the point expansion of the second tubular will be initiated. On the basis of this information, it can be determined whether a spacer or other coupling mechanism is required between the first and second tubulars. Similarly, further aspects of the invention relate to determining a material property of a tubular and then selecting a further tubular having the material properties necessary to achieve an appropriate level of interference therebetween, or simply to determining the suitability for coupling of two tubulars. The determination of suitability may be carried out using any appropriate method, including finite element analysis (FEA).

For the first aspect, the materials utilised to form the tubulars may have the same or similar elastic moduli.

Of course the aspects of the invention may be combined, that is by providing a second tubular with a greater yield strength and a lower modulus of elasticity.

BRIEF DESCRIPTION OF THE DRAWINGS

These and other aspects of the present invention will now be described, by way of example, with reference to the accompanying drawings, in which:

Figures 1 and 2 are schematic sectional views of steps in creating a liner hanger in accordance with an embodiment of the present invention; and

Figure 3 is a sectional schematic view of a liner hanger in accordance with a further embodiment of the present invention.

DETAILED DESCRIPTION OF THE DRAWINGS

Reference is first made to Figure 1 of the drawings, which illustrates a section of a drilled bore 10 into which a first tubular, in the form of a liner 12, has been run, with the upper end of the liner 12 overlapping the lower end of a second tubular, in the form of existing casing 14.

The liner 12 has an outer diameter smaller than the inner diameter of the casing 14, to allow the liner 12 to be run through the casing.

An expansion device, in this example a conical swage 16, has been run into the bore with the liner 12, and is run through at least the upper end portion of the liner 12. The degree of expansion is such that the outer face of the liner 12 contacts the inner face of the casing 14 and expands the casing 14; the annulus surrounding the lower end of the casing has been left free of cement, to permit expansion of the casing. The degree of expansion of the liner 12 is further selected such that the liner 12 experiences an expansion force in excess of its yield strength, that is the liner 12 is subject to permanent

plastic deformation.

After the expansion device 16 has passed through the overlap between the liner 12 and casing 14, as illustrated in Figure 2, the tubulars 12, 14 experience a degree of elastic recovery. To provide an appropriate level of contact stress and interference, the degree of elastic recovery of the casing 14 is greater than that of the liner 12. This is achieved by selecting a casing material having one or both of a lower modulus of elasticity and higher yield strength than the liner material.

EXAMPLE 1

In a first example, the casing 14 is of titanium alloy, with a Young's modulus (E) of elasticity of $15 - 17 \times 10^6$ psi. The liner 12 is of a A106 Grade B steel, having a modulus of $29 - 30 \times 10^6$ psi (180 - 210 GPa). Following expansion, the degree of elastic recovery of the casing 14 is of the order of twice the degree of recovery of the liner 12, with the result that there is significant contact stress (2,830 psi) between the liner 12 and casing 14, leading to the creation of a secure, fluid tight hanger.

EXAMPLE 2

In a second example, the liner 12 is in the form of A106 Grade B line pipe with a yield strength of 46,500 psi, while the casing 14 is in the form of L80 casing with a yield strength of 98,500 psi. The initial outside diameter

of the liner 12 and the inside diameter of the casing 14 are both approximately $7\frac{5}{8}$ ", and both have a wall thickness of $\frac{3}{8}$ ".

The degree of expansion was selected such that both
5 the liner 12 and casing 14 experienced stress 10% above their yield points.

Once the expansion force is removed, and the tubulars 12, 14 are permitted to relax, a contact stress of 2400 - 2500 psi (determined by FEA) is created between the
10 tubulars due to the differential elastic recovery of the liner 12 and casing 14. This level of stress is sufficient to permit the liner to be hung from the casing 14 and, assuming the contacting surfaces are reasonably smooth, creates a fluid-tight seal between the tubulars, obviating
15 the requirement for elastomeric seals.

COMPARATIVE EXAMPLE 3

In this comparative example, the same materials and tubular dimensions as described in Example 2 were utilised,
20 however the materials were reversed, that is the liner 12 was formed of L80 line pipe and the casing 14 of the lower yield A106 Grade B line pipe.

As with Example 2, the degree of expansion was selected such that both the liner 12 and casing 14
25 experience stress 10% above their yield points.

Following expansion, the greater elastic recovery of the higher yield strength liner 12 was found to result in

a small (0.005") radial annular gap appearing between the liner 12 and the casing 14.

It will thus be apparent to those of skill in the art that the appropriate determination and selection of material properties, as taught by the present invention, is
5 important in achieving a secure and reliable coupling between expanded tubulars. In other aspects of the invention material properties other than yield strength and elastic modulus may be determined and selected with a view
10 to ensuring that a secure coupling is achieved.

Reference is now made to Figure 3 of the drawings, which is a sectional schematic view of a liner hanger 50 in accordance with a further embodiment of the present invention. The liner hanger 50 is created in a similar
15 manner to the hanger described above with reference to Figures 1 and 2. However, in this example the liner 52 and the casing 54 are formed of similar materials having similar material properties, such as an appropriate steel. To ensure the creation of a secure interference coupling
20 between the tubulars 52, 54, the expansion behaviour of the lower end of the casing 54 is modified by fitting a band 56 of titanium alloy around the casing 54. Thus, the composite portion of the casing 54, 56 will experience a greater degree of elastic recovery than the liner 52
25 following expansion, to create a secure and fluid-tight coupling between the liner 52 and the casing 54.

This embodiment offers the advantage that sections of

tubular of the same or similar properties may be used to line well bore in accordance with embodiments of the invention, with the expansion properties of localised portions of the tubular sections being modified simply by
5 providing a relatively short band or ring of an appropriate material around the portion of tubular which will form the outer tubular at the coupling between the sections.

Those of skill in the art will appreciate that the above described embodiments are merely exemplary of the
10 present invention and that various modifications and improvements may be made thereto, without departing from the scope of the invention. For example, in the above described examples it is assumed that expansion occurs due to substantially uniform deformation or extension of the
15 tubulars walls, however in other embodiments the deformation may be non-uniform or may be limited to selected portions of the bore wall; the expansion may be as a result of circumferential extension of only a part of the wall of one or both of the tubulars, the expansion may
20 result in the creation of a non-circular form, and indeed one or both of the tubulars may initially be non-circular.

In other embodiments, the coupling between the liner and casing may be formed by following a different sequence of events. For example, liner may be run through casing
25 and then the upper end of the liner expanded below the casing to an inner diameter larger than the outer diameter of the lower end of the casing. The liner may then be

lifted such that the expanded upper end of the liner surrounds the lower end of the casing. The lower end of the casing is then expanded into contact with the previously expanded upper end of the liner.

CLAIMS

1. A method of coupling first and second tubulars, the method comprising:

5 providing a first tubular having a first yield strength;

providing a second tubular having a second yield strength greater than said first yield strength;

10 locating at least a portion of the first tubular within and overlapping at least a portion of the second tubular;

expanding said portion of the first tubular sufficient to expand said portion of the second tubular, at least the first tubular being expanded beyond its yield point; and then

15 permitting at least a degree of elastic relaxation of the tubulars.

2. The method of claim 1, comprising expanding said portion of the first tubular by application of an expansion force thereto and then at least reducing said expansion force to permit said degree of elastic relaxation of the tubulars.

3. The method of claim 1 or 2, comprising expanding the

tubulars downhole.

4. The method of claim 3, wherein the first tubular is liner.

5. The method of claim 3 or 4, wherein the second
5 tubular is casing.

6. The method of any of the preceding claims, further comprising hanging the first tubular off the second tubular.

7. The method of any of the preceding claims, further
10 comprising forming a fluid seal between the tubulars.

8. The method of any of the preceding claims, comprising expanding the second tubular at least to its yield point.

9. The method of any of the preceding claims, comprising expanding the second tubular beyond its yield point.

15 10. The method of any of the preceding claims, comprising expanding the tubulars by forcing an expansion cone through the first tubular.

11. The method of any of the preceding claims, comprising expanding the tubulars by rolling expansion.

12. The method of any of the preceding claims, comprising expanding the tubulars using a compliant expander device providing a minimum degree of expansion sufficient to expand the first tubular through yield.

5 13. The method of any of the preceding claims, comprising maintaining an annulus surrounding said portion of the second tubular free of material that would restrict the desired degree of expansion of the tubulars.

10 14. The method of any of the preceding claims, comprising expanding the first tubular to contact the second tubular.

15 15. The method of any of the preceding claims, comprising selecting the yield strength of the first tubular to be lower than the yield strength of the second tubular before expansion of the tubulars.

16 16. The method of any of claims 1 to 14, comprising selecting the yield strength of the first tubular to be lower than the yield strength of the second tubular at the point deformation of the second tubular is initiated.

20 17. The method of any of the preceding claims, comprising selecting the materials utilised to form the tubulars such that the tubulars have similar elastic moduli.

18. The method of any of claims 1 to 16, comprising selecting the materials utilised to form the tubulars such that the second tubular has a lower elastic modulus than the first tubular.

5 19. The method of any of the preceding claims, comprising selecting the degree of expansion to accommodate known variables and to ensure expansion of the second tubular to a minimum predetermined degree.

20. A method of coupling a first tubular with a second
10 tubular, the method comprising:

determining the yield strength of a second tubular;

selecting a first tubular having a yield strength less
than said determined second yield strength;

15 locating at least a portion of the first tubular
within and overlapping at least a portion of the second
tubular;

expanding said portion of the first tubular sufficient
to expand said portion of the second tubular, at least the
first tubular being expanded beyond its yield point; and

20 permitting at least a degree of elastic relaxation of
the tubulars.

21. A method of coupling a first tubular with a second
tubular, the method comprising:

25 determining the yield strength of a first tubular;

selecting a second tubular having a yield strength greater than said determined first yield strength;

5 locating at least a portion of the first tubular within and overlapping at least a portion of the second tubular;

expanding said portion of the first tubular sufficient to expand said portion of the second tubular, at least the first tubular being expanded beyond its yield point; and

10 permitting at least a degree of elastic relaxation of the tubulars.

22. A tubing hanger made in accordance with the method of any of the preceding claims.

23. A tubing coupling assembly comprising:

15 an expandable first tubular having a first yield strength; and

20 an expandable second tubular having a second yield strength greater than said first yield strength, at least a portion of the second tubular being adapted to receive at least a portion of the first tubular, and said portion of the first tubular being expandable beyond its yield point to expand said portion of the second tubular.

24. The assembly of claim 23, wherein the tubulars are adapted for use downhole for lining a drilled bore.

25. The assembly of claim 24, wherein the first tubular is liner.

26. The assembly of claim 24 or 25, wherein the second tubular is casing.

5 27. The assembly of any of claims 23 to 26, wherein at least one tubular has substantially constant material properties over its length.

28. The assembly of any of claims 23 to 26, wherein at least one of said portions of said first and second
10 tubulars has different material properties from another portion of the respective tubular.

29. The assembly of claim 28, wherein said portion of the second tubular comprises inner and outer wall portions of different material properties.

15 30. The assembly of claim 29, wherein said outer wall portion has a yield strength higher than said inner wall portion.

31. The assembly of claim 29 or 30, wherein said inner and outer wall portions are integral.

20 32. The assembly of claim 29 or 30, wherein said inner and

outer wall portions comprise separate members.

33. The assembly of any of claims 23 to 32, further comprising an expansion device.

5 34. The assembly of claim 33, comprising an expansion cone.

35. The assembly of claim 33 or 34, comprising a roller expander.

10 36. The assembly of any of claims 33, 34 or 35, comprising a compliant expansion device providing a minimum degree of expansion sufficient to expand the first tubular through yield.

37. The assembly of any of claims 23 to 36, wherein the materials utilised to form the tubulars have the same or similar elastic moduli.

15 38. The assembly of any of claims 23 to 36, wherein the second tubular has a lower modulus of elasticity than the first tubular.

39. A method of coupling first and second tubulars, the method comprising:

20 providing a first tubular having a first modulus of

elasticity;

providing a second tubular having a second modulus of elasticity lower than said first modulus of elasticity;

5 locating at least a portion of the first tubular within at least a portion of the second tubular;

expanding said portion of the first tubular sufficient to expand said portion of the second tubular; and

permitting at least a degree of elastic contraction of the tubulars.

10 40. The method of claim 39, comprising expanding said portion of the first tubular by application of an expansion force thereto and then at least reducing said expansion force to permit said degree of elastic relaxation of the tubulars.

15 41. The method of claim 39 or 40, comprising expanding the tubulars downhole.

42. The method of claim 41, wherein the first tubular is liner.

20 43. The method of claim 41 or 42, wherein the second tubular is casing.

44. The method of claim 41, 42 or 43, further comprising hanging the first tubular off the second tubular.

45. The method of any of claims 39 to 44, further comprising forming a fluid seal between the tubulars.

46. The method of any of claims 39 to 45, comprising expanding the first tubular at least to its yield point.

5 47. The method of any of claims 39 to 46, comprising expanding the first tubular beyond its yield point.

48. The method of any of claims 39 to 47, comprising expanding the second tubular at least to its yield point.

10 49. The method of any of claims 39 to 48, comprising expanding the second tubular beyond its yield point..

50. The method of any of claims 39 to 49, comprising forcing an expansion cone through the tubulars.

51. The method of any of claims 39 to 50, comprising expanding the tubulars by rolling expansion.

15 52. The method of any of claims 39 to 51, comprising expanding the tubulars using a compliant expander device providing a minimum degree of expansion sufficient to expand the first tubular through yield.

53. The method of any of claims 39 to 52, comprising

maintaining an annulus surrounding said portion of the second tubular free of material that would restrict the desired degree of expansion of the tubulars.

54. The method of any of the claims 39 to 53, comprising
5 expanding the first tubular to contact the second tubular.

55. The method of any of claims 39 to 54, comprising selecting the yield strength of the first tubular to be lower than the yield strength of the second tubular.

56. The method of any of claim 39 to 55, comprising
10 selecting the yield strength of the first tubular to be lower than the yield strength of the second tubular before expansion.

57. The method of any of claims 39 to 55, comprising selecting the yield strength of the first tubular to be
15 lower than the yield strength of the second tubular at the point deformation of the second tubular is initiated.

58. The method of any of claims 39 to 57, comprising selecting the degree of expansion to accommodate known variables and to ensure expansion of the tubulars to a
20 minimum predetermined degree.

59. A method of coupling a first tubular with a second

tubular, the method comprising:

determining the elastic modulus of a second tubular;

selecting a first tubular having an elastic modulus greater than said determined second modulus;

5 locating at least a portion of the first tubular within and overlapping at least a portion of the second tubular;

expanding said portion of the first tubular sufficient to expand said portion of the second tubular; and

10 permitting at least a degree of elastic relaxation of the expanded tubulars.

60. A method of coupling a first tubular with a second tubular, the method comprising:

15 determining the elastic modulus of a first tubular;

selecting a second tubular having an elastic modulus lower than said determined first modulus;

20 locating at least a portion of the first tubular within and overlapping at least a portion of the second tubular;

expanding said portion of the first tubular sufficient to expand said portion of the second tubular; and

permitting at least a degree of elastic relaxation of the tubulars.

25 61. A tubing hanger made in accordance with the method of any of claims 39 to 60.

62. A tubing coupling assembly comprising:

an expandable first tubular having a first modulus of elasticity; and

an expandable second tubular having a second modulus of elasticity less than said first modulus, at least a portion of the second tubular being adapted to receive at least a portion of the first tubular, and said portion of the first tubular being expandable to expand said portion of the second tubular.

63. The assembly of claim 62, wherein the tubulars are adapted for use downhole for lining a drilled bore.

64. The assembly of claim 63, wherein the first tubular is liner.

65. The assembly of claim 63 or 64, wherein the second tubular is casing.

66. The assembly of any of claims 62 to 65, wherein at least one tubular has substantially constant material properties over its length.

67. The assembly of any of claims 62 to 65, wherein at least one of said portions of said first and second tubulars has different material properties from another portion of the respective tubular.

68. The assembly of claim 67, wherein said portion of the second tubular comprises inner and outer wall portions of different material properties.

69. The assembly of claim 68, wherein said outer wall portion has a modulus lower than said inner wall portion.

70. The assembly of claim 68 or 69, wherein said inner and outer wall portions are integral.

71. The assembly of claim 68 or 69, wherein said inner and outer wall portions comprise separate members.

72. The assembly of any of claims 62 to 71, further comprising an expansion device.

73. The assembly of any of claims 62 to 72, further comprising an expansion cone.

74. The assembly of any of claims 62 to 73, further comprising a rolling expander.

75. The method of any of claims 62 to 74, further comprising a compliant expansion device adapted to provide a minimum degree of expansion sufficient to expand the first tubular through yield.

76. The assembly of any of claims 62 to 75, wherein the first tubular has a first yield strength and the second tubular has a second yield strength, the second yield strength being greater than said first yield strength.

5 77. A method of determining the suitability of a first tubular for coupling with a second tubular by expansion of the first tubular within the second tubular to expand the second tubular and such that at least the first tubular passes through yield, the method comprising determining the
10 yield strengths of the first and second tubulars.

78. A method of determining the suitability of a first tubular for coupling with a second tubular by expansion of the first tubular within the second tubular to expand the second tubular, the method comprising determining the
15 elastic moduli of the first and second tubulars.
